Amendments to the Health Insurance Law</li> <li>4. Long term care insurance law</li> </ul>	<ul style="list-style-type: none"> <li>1. Clarification of procedures for establishing facilities, countermeasures against illegal dumping</li> <li>2. Child care system reform</li> <li>3. 80% benefits for the insured</li> </ul>	Social Security Reform
1998	Agreement between Japan and Germany on Social Security		
1999	Infectious Disease Prevention Law		

TBC was the common illness during 1950's and 1960's. The health pattern changed drastically in 1970's from infectious disease to hypertensive disease, mental disorder, cerebrovascular disease, liver disease, diabetes, and malignant neoplasms. Preventive health care is one of major public health policy, which includes health education, health consultation, check-ups, immunization, and other activities. Rehabilitation, day-care service, home help, and recreational activities promoted by local government are viewed to improve preventive health care.

Local government is primarily responsible for health centers that carry out preventive health program. Health centers advise the municipal health sections, which have been executing agencies of the program.

Throughout the reform the following basic elements of policy have remained in place:

- Universal coverage for all inhabitants and employees
- Collective financing through public medical care insurance scheme
- Largely private provision of services
- A uniform fee schedule applied to all medical facilities and insurers under the public medical care insurance schemes

Statistics and Information Bureau of the Ministry of Health and Welfare estimates the National Medical Expenditures (NME). Medical expenditures are roughly defined as the information on the aggregate expenses paid by third parties or patients to providers of medical care in the year.

NME is limited to payments to medical institutions and tends to be smaller. It does not include public expenditure except for payments made through public medical care insurance schemes. It does not include subsidies to public healthservice providers, expenditure on preventive methods or other public health activities, administrative costs of public schemes, and so on. Household expenditures, out-of-pocket are not included either..

Hospitals are health facilities that can take 20 in-patients or more. Clinics are health facilities that only take fewer than 20 in-patients or no in-patients at all.

Medical facilities by type of establishment, 1991

	Hospitals	General Clinics	Dental Clinics
Private	81	93.7	99.4
Individual	29	73.1	93.1
Medical juridical corporations	43.5	11.8	5.6
Public	19.	6.3	0.6

Total	100	100	100

(The Reform of Health Care System, OECD).

Health Insurance Schemes:

- Employees' Health Insurance System (EHI)
  - ✧ Government managed Social Insurance Agency  
Covers employees of medium-sized and small industries
  - ✧ Society managed (individual-company based)  
Covers employees of large industries
  - ✧ Seamen's Insurance
  - ✧ Mutual Aid Associations for central, prefectural or municipal government employees
- National Health Insurance (NHI)  
Covers self-employed retired employees, etc.

Patients receive benefits in-kind such as out-patients care, hospital inpatient care, drugs. Cash are available for sickness, injury allowances, and maternity allowances. The benefits are equal (at equal cost) for all insured irrespective of their income.

Medical services are based on the uniform fee schedule regulated by Ministry of Health and Welfare.

Fees schedule include:

- Operational costs
- Consultation
- Examination
- Diagnosis
- Treatment
- Surgery
- Medication
- Injection
- Hospitalization

The fee schedule are attempted to reimburse the management of an ordinary medical facility. Capital investment cost are not included, and usually provided by loan from commercial bank or Social Welfare and Medical Corporation, a semi-governmental financial organization.

The fee schedule allows the patients to have a suitable treatment. But, it also allows the practitioners to

do more examinations and prescribe more unnecessary drugs. More reforms on the reimbursement system have been placed to control for the drawback of the fee schedule systems.

The major financing of health insurance is from health insurance contributions (56%), central government (25%), local government (7%), and patients' co-payment (12%). **(1994)** The financing scheme varies by type of insurance. National Health Insurance (NHI) receives more subsidy from the government (50%) and other health insurance schemes (EHI, Social Insurance Agency (EMI)) receive less. Despite of large contributions of National Health Insurance (NHI) system received from the government, the scheme offers fewer benefits compare to those of EHI. NHI largely consist of elderly and low income population. Because of heavily concentrated on the elderly insured participants on NHI, as well as high contributions from the government, central government (Ministry of Health and Welfare) bear for heavy financial burden, particularly the proportion of elderly are increasing with growing rates.

National Medical Expenditures, accounted for 6% to 6.3% of National Income, have been increasing for several reasons; population increase, demographic change in disease patterns, advances and availability of medical technology, behavior of doctors and others under enacted laws and rules. Under lack of restrictions on the medical establishment, inefficient medical resources allocation and excessive number of hospitals beds are growing. Doctors earn more by dispensing more pharmaceuticals that are fully reimbursed. Therefore, they are motivated to dispense excessive pharmaceuticals.
