

Intergenerational transfers for men and  
women in Sweden 2003: A first look at  
flows in the formal sectors

Thomas Lindh, Daniel Hallberg, Jovan Žamac

Institute for Futures Studies

# Why gender decomposition?

- Due to both demographic and social factors we can expect age profiles to differ by gender.
  - Household production
  - Child birth
  - Survival rates
  - Marriage patterns
- The differences indicate social institutions and approaches to intergenerational redistribution that lie outside the National Accounts (and thus the NTAs)

# Female LCD > male LCD

- Are household production transfers compensating for public transfers over time?
- Can a shifting private and public balance explain delayed adulthood and female higher education?
- How is gender equality and cohort equality affected by the regime of public/private transfers?

# Sweden is (not) gender equal?

- Women more educated and womens' employment high but...
- ...unexplained wage gap
- ...public sector segregation: care and teaching
- ...household work

# Gender specific macro controls

- Must be estimated
- gender specific unadjusted (but smoothed) age profiles from micro data,
- aggregate by the gender specific population to get shares, e.g.

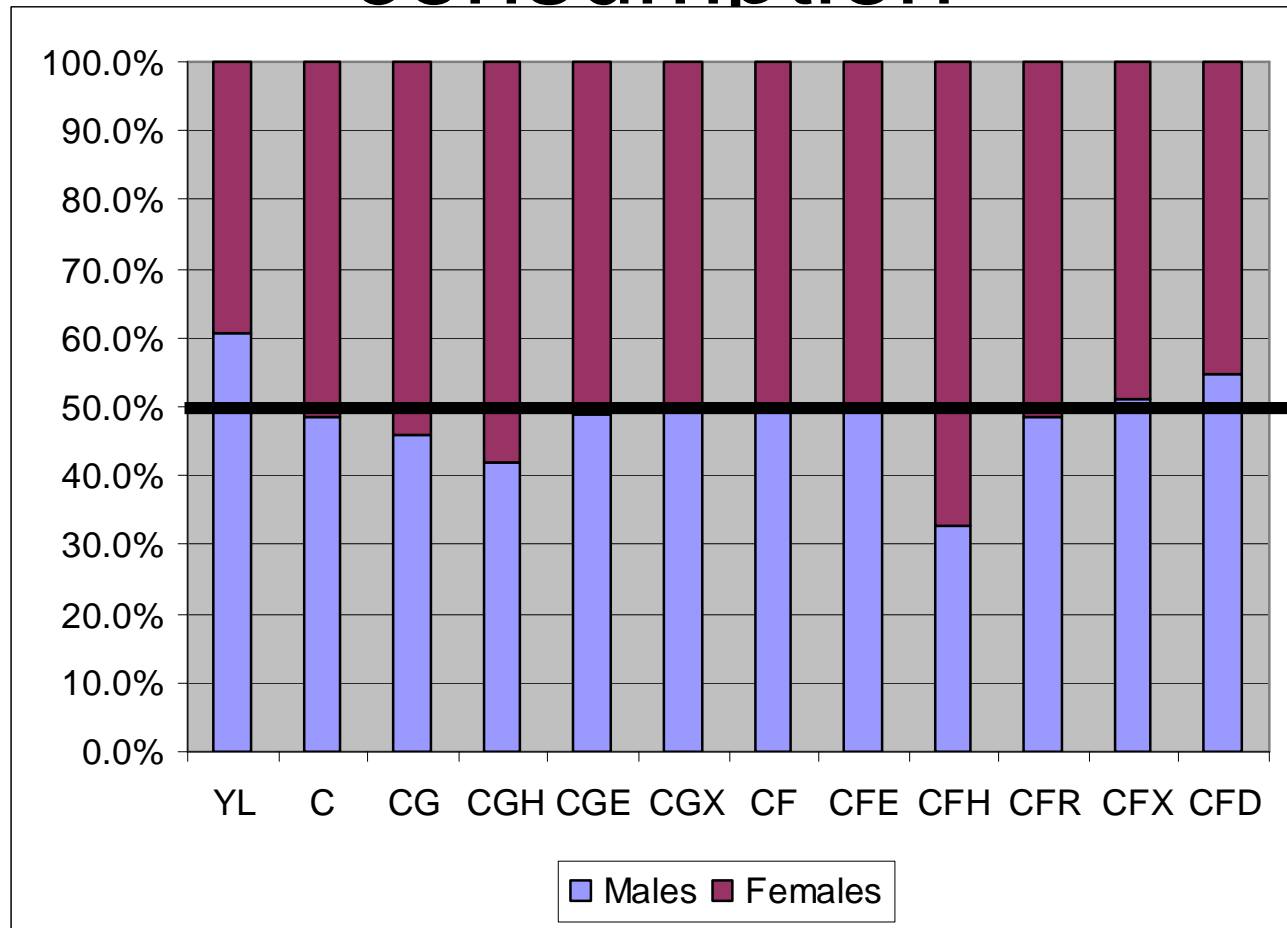

$$YLE(k) = \frac{\sum_a yle(k, a) * pop(k, a)}{\sum_a yle(M, a) * pop(M, a) + \sum_a yle(F, a) * pop(F, a)} * YLE$$

- $k=M, F$

# Macro controls by gender, MSEK

|     | <i>Males</i> | <i>Females</i> | <i>sum</i> |
|-----|--------------|----------------|------------|
| LCD | -148 325     | 227 611        | 79 285     |
| YL  | 941 952      | 612 895        | 1 554 847  |
| C   | 793 627      | 840 505        | 1 634 132  |
| CG  | 318 770      | 372 924        | 691 694    |
| CGH | 120 738      | 168 266        | 289 005    |
| CGE | 94 112       | 98 812         | 192 924    |
| CGX | 103 920      | 105 845        | 209 765    |
| CF  | 474 856      | 467 582        | 942 438    |
| CFE | 3 193        | 3 176          | 6 369      |
| CFH | 10 658       | 21 890         | 32 548     |
| CFR | 110 021      | 117 399        | 227 419    |
| CFX | 278 259      | 264 929        | 543 188    |
| CFD | 72 725       | 60 188         | 132 913    |

# Gender distribution of labor income, private and public consumption

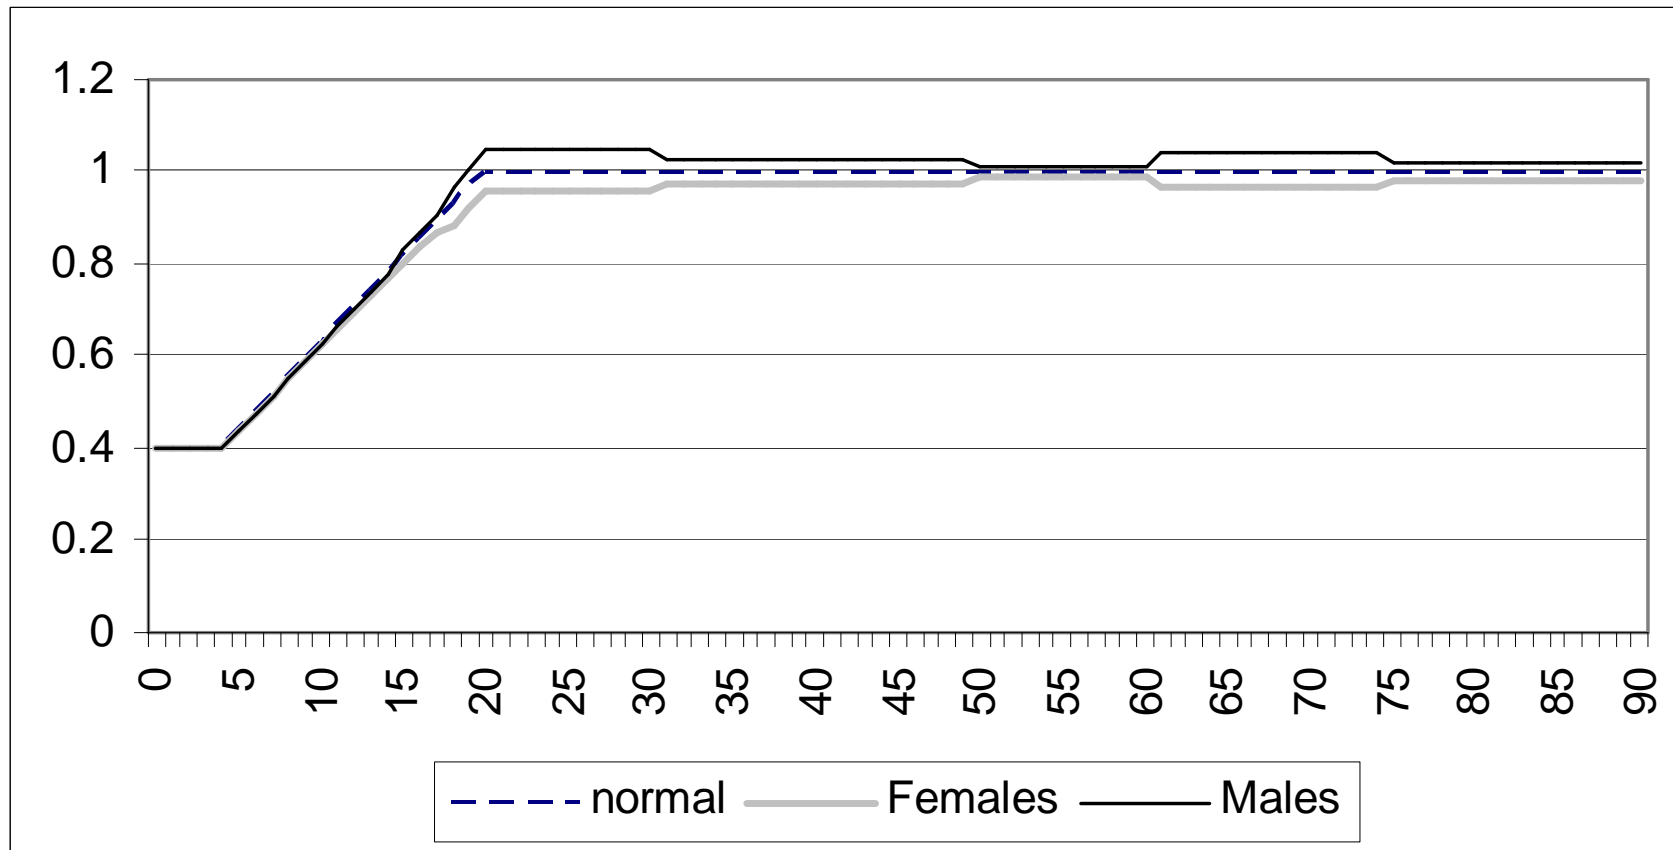

# Method for estimating private consumption by gender

- Private education and private health (CFE and CFH) are allocated using the regression method with gender specific age group estimates.
- Residential, durables, and other private consumption (CFR, CFD, CFX) are allocated according to the 'ad-hoc' rule (equivalence scale) using gender specific consumption data from the Swedish Consumer Agency (*Konsumentverket*).

# The resulting equivalence scales

# Public consumption by gender

- Collected from official sources
- Detailed distribution by 1-year age groups on health and care expenditure from detailed statistics compiled in the county of Skåne.

# Public and private health consumption

Women spend much more on public health consumption

Women spend more on private health consumption

# Education consumption

- Public
  - Women consume more

- Private
  - equal

# Consumption by equivalence scale

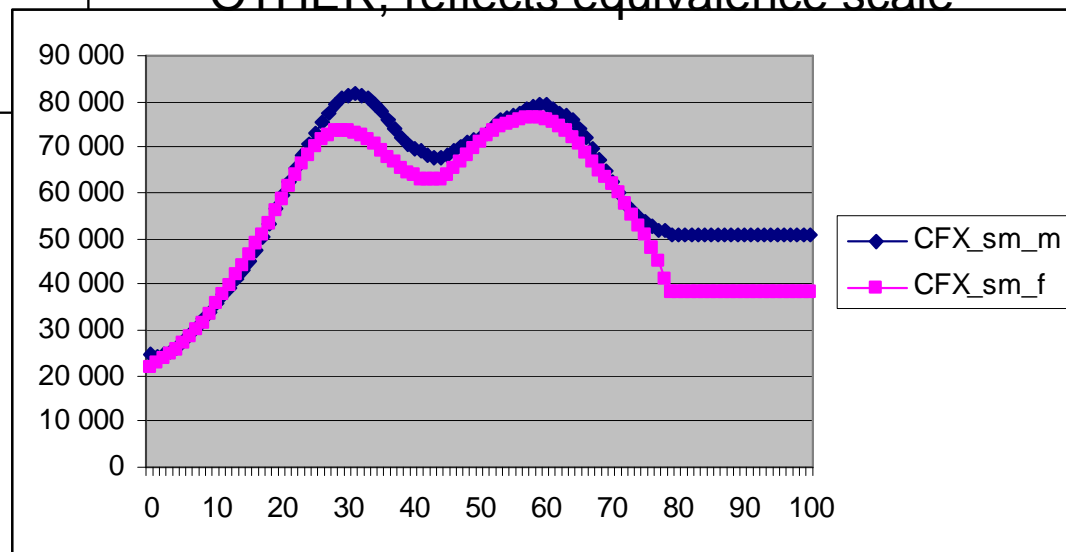

## Durables (common goods?)

## Residential (more female singles)

## OTHER, reflects equivalence scale

Are there better allocation rules

# Labor earnings profiles

women earn less

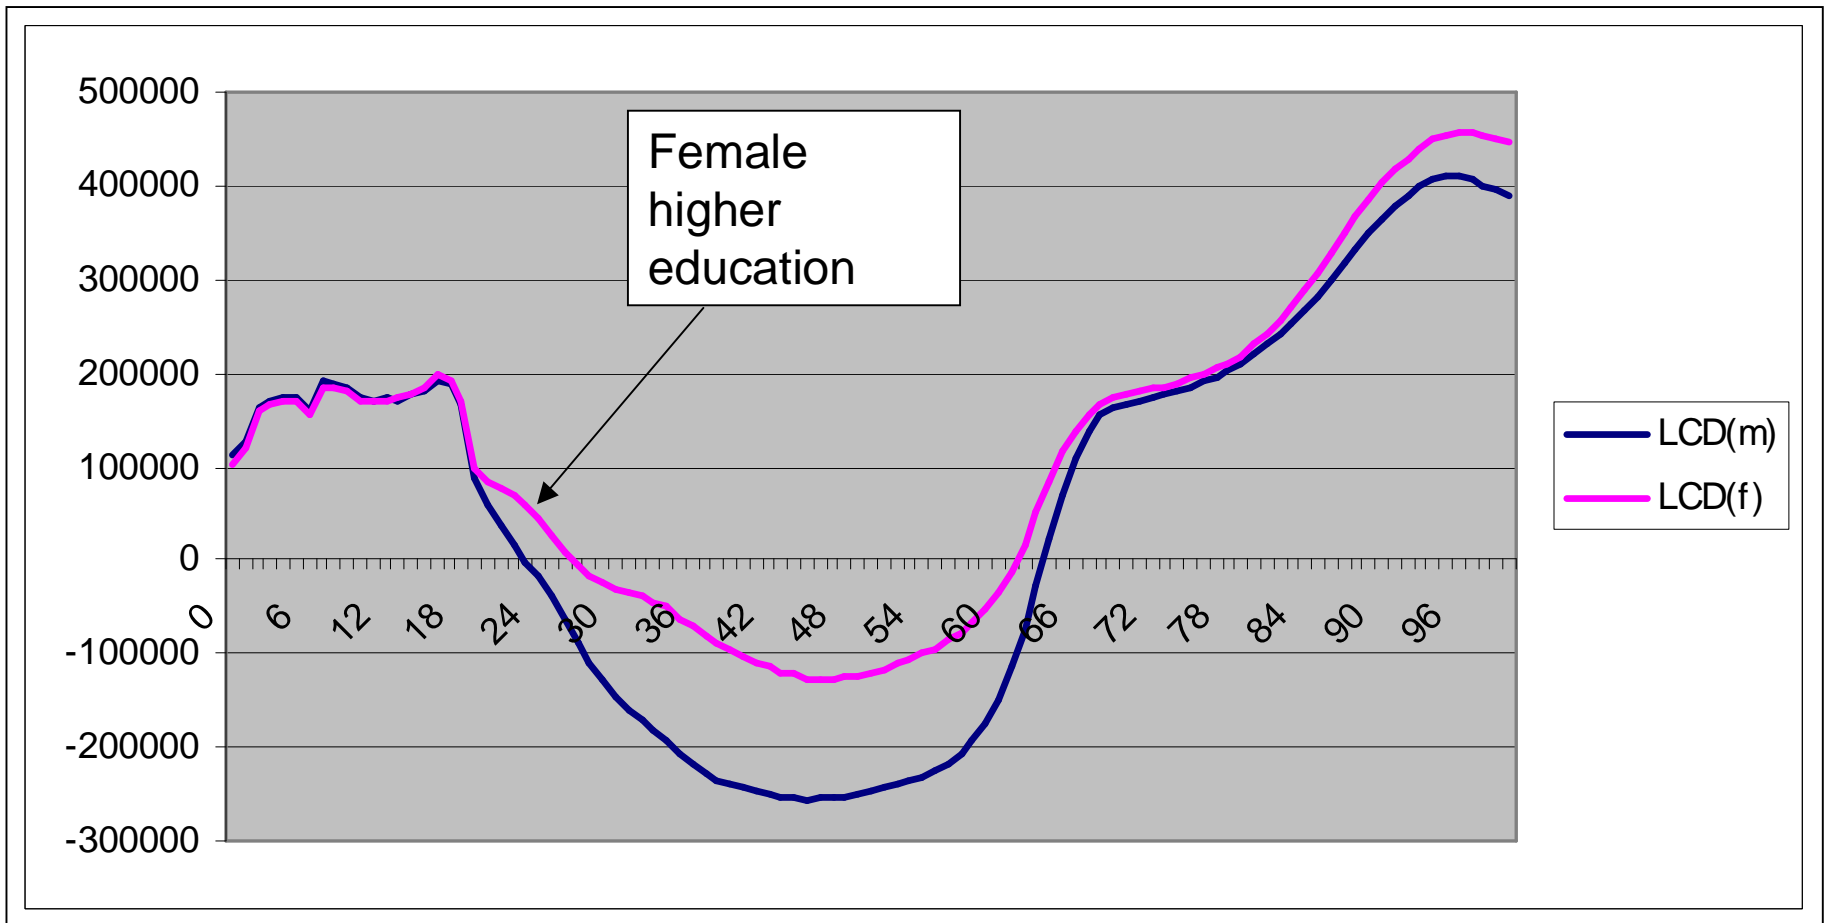

# Employment and self-employment

## Women earn much less in self-employment

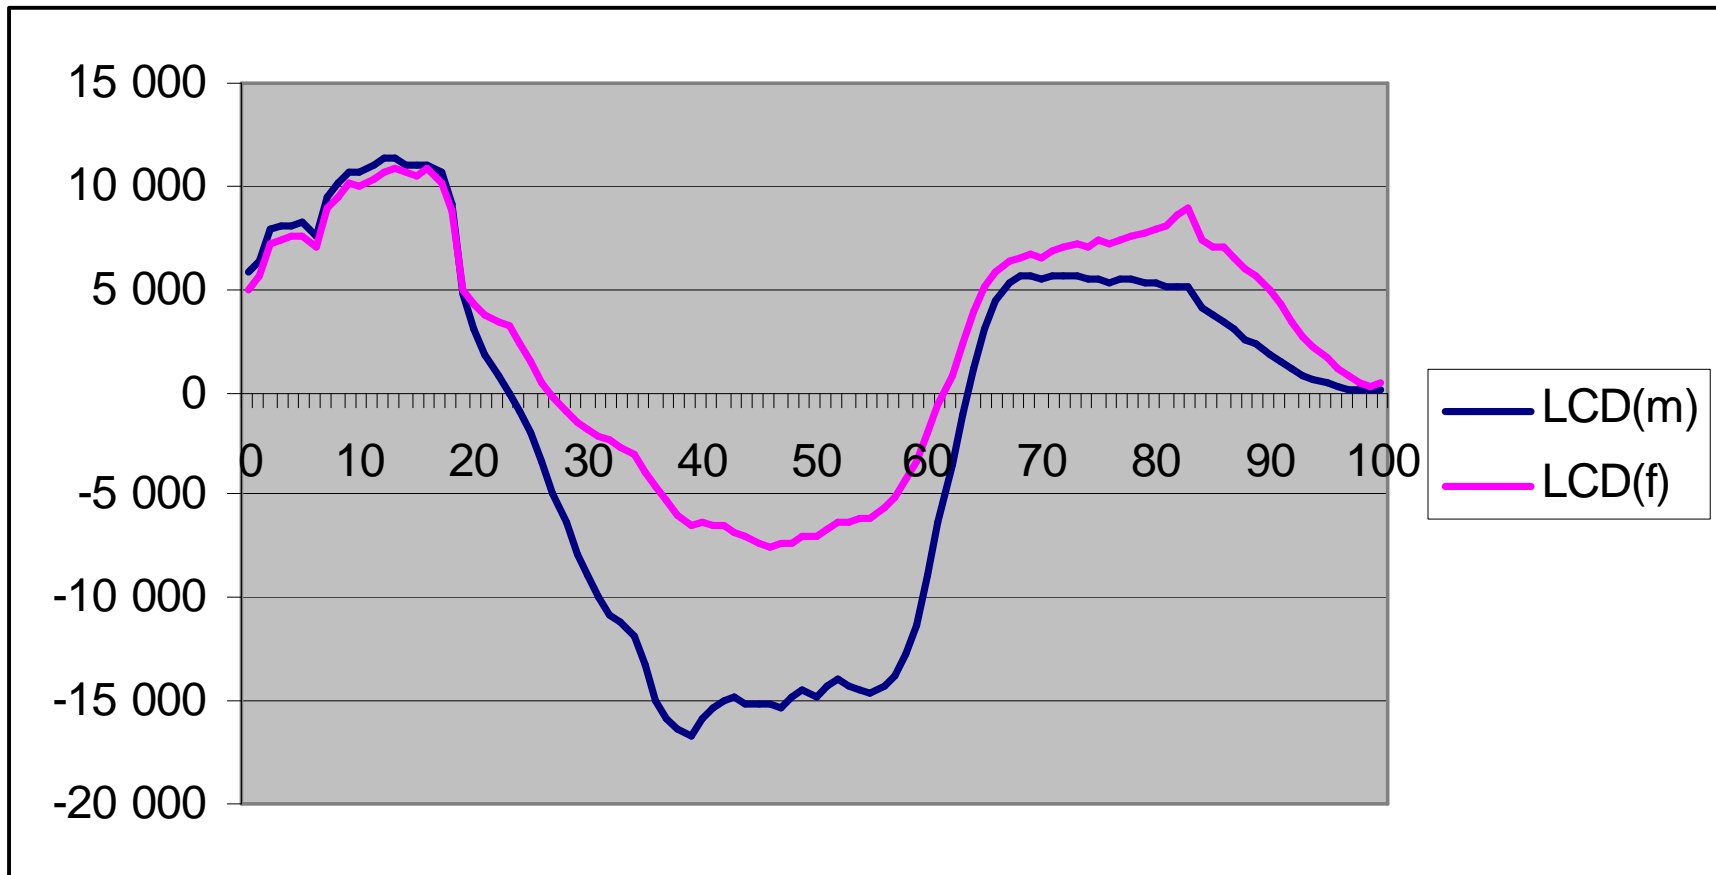

# Life cycle deficits

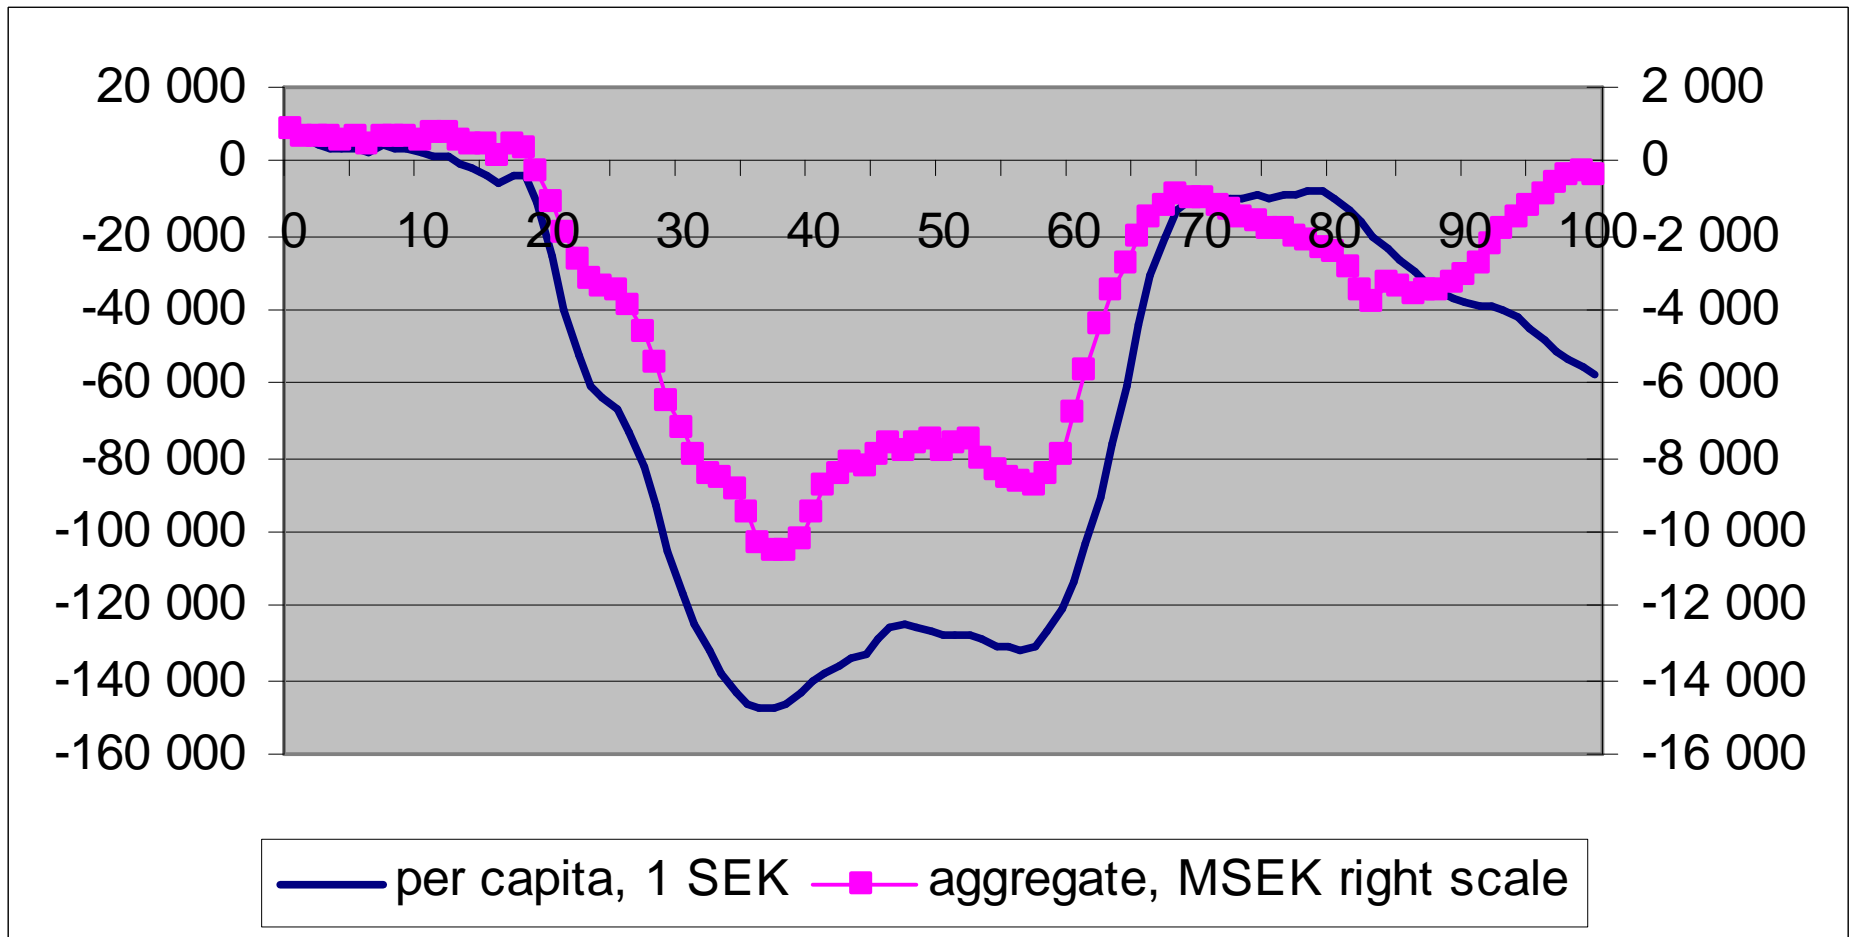

# Population-weighted LCD

# Female –male LCD per capita and aggregate

# Public redistribution of income to females

- Substantial part of female total income in reproductive ages benefits received from the social security system

Earnings and asset reallocation as share of total income

# Main problems

- Transfers within households
  - Convention of household head allocation troublesome in this context
  - Maybe two household heads in intact couple households?
- What is really gender-specific consumption?
- Household bargaining and household production?

# Interpretation and summary

- Within the National Accounts framework females are subsidised by males...
- ...but we know that females do most of the household production
- ...have lower labor income
- Most of the consumption gender difference is associated with public health care and elderly care

# Issues to pursue

- Relative importance ?
  - wage gap about 10 percent for equal work.
  - gender segregation in the labor market
  - females enrolling and staying in higher education to a larger extent than males.
- Strong female dominance among those who need public assistance as elderly. Also a higher or costlier morbidity for females?
- Future policies for elderly care
  - higher amount of household work performed by women compensate?
  - Home care and female labor supply.
- Female LCD financed by
  - public as well as private transfers and of reallocation of assets.
  - How we define household head will become increasingly important.
